I've created a site with Reveal which means it was more-so a presentation. The site was about some JavaScript and jQuery plug-ins and libraries I've found at GitHub. I've discussed them and demonstrated how they are used as well as how they behave.

I've chosen Plyr because it was something I'd found at GitHub a while ago which was very pretty, lightweight, and much better than most browsers' native video interfaces. I think it's much better to use a plug-in for media rather than relying on a browsers' interface because they're usually inconsistent with other browser interfaces and they can usually be ugly. It's clear that functionality was prioritised over design and user friendliness.

I've also chosen Vide, which is a plug-in for creating backgrounds from video as easily as possible. This plug-in has one dependency — jQuery — and it couldn't be more simple to set up and use, so I wanted to share it with everyone watching.

My presentation can be found over at YouTube.
